Lab protocols for Rps10

Here you can find the lab protocols for using the Rps10 barcode for amplicon metagenomics (aka metabarcoding) and generating sequences to contribute to the database. Note that the primers used to generate amplicons short enough for high-throughput sequencing are not the same as those used to generate the database. Make sure you are using the correct protocol for you goals.

Rps10 oligos were designed by Frank Martin and Val Fieland.

Metagenomics protocols

These relate to using the Rps10 barcode for metagenomics research.

Database protocols

These relate to generating sequences to contribute to the Rps10 reference database hosted on this website.
